### OVERVIEW

Alzheimer's disease (AD) is a neurodegenerative disorder characterized by progressive decline in memory and other aspect of cognition and is the most common cause of dementia in the elderly. The average duration from onset of symptoms to nursing home placement is about 5 to 7 years. Accurate diagnosis of AD is sometimes difficult due to lack of reliable non-invasive biomarkers, although the diagnostic criteria have been proposed based on clinical presentation and history. A reliable or ideal biomarker should base on the presence of disease-specific pathology, and should be helpful in follow-up the disease course, evaluation of treatment effect and for presymptomatic identification of subjects at risk for developing AD.

# Qualification of Neuropsychological tests

MMSE	Chinese Version Verbal Learning Test
CDR	Geriatric Depression Scale
WMS III Logical Memory story A recall	Clock drawing Test
Everyday Cognition (ECog)	Neuropsychiatric Inventory Q
Montreal Cognitive Assessment (MoCA)	ADAS-Cog 11 (with Delayed Word Recall)
Category Fluency (Animals)	Activities of Daily Living (FAQ)
Trails A & B	Chinese version Verbal Learning Test
Boston Naming Test (30-item)	

# QC controls of Biofluids markers

- Setting of collection SOP
  - Barcode, collection tube, temperature requirement, sample tracking, shipping, storage
- Regulation of equipment and personnel
- Alarm system-SOP
- Barcode system
- GLP certification
- Test run-July, 2011

# TW-ADNI MRI core - Aims

More than a neuroimaging repository for AD

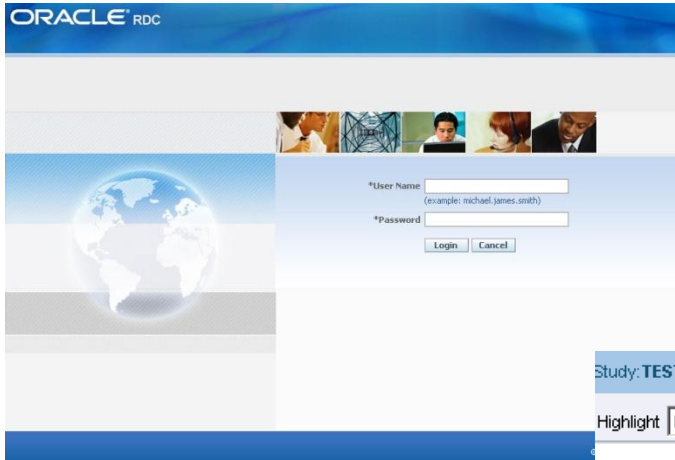

- ◆ Establish *standard protocol* for MRI acquisition
- ◆ Develop and implement *methods for quality control* of MR images
- ◆ Improve the *post-processing methods*
- ◆ Investigate *functional connectivity of brain*

# PET core protocol -Two scans

- All scans will be acquired in pairs of [ $^{18}\text{F}$ ]FDG and [ $^{18}\text{F}$ ]AV45 scans,
- performed on separate days, between **1 day and 2 weeks apart**, with either scan performed first.

# 18F-AV-45 Brain Imaging (Phase I)

Time-activity curve of [18F]AV-45 brain PET images from three healthy controls and three patients with Alzheimer's disease (A and B). Average SUV<sub>cor</sub> curves in frontal cortex over 90-min time period in AD patients and controls (C). The dashed lines indicate a third order polynomial curve fitting to data. SUV<sub>cor</sub> of other brain regions at time period between 45-55 min post-injection in all subjects (D). Data were displayed in mean  $\pm$  SD.

# Different stage of AD

The software interface displays three brain slices (axial, sagittal, and coronal) with color-coded regions. The axial slice is labeled 'EMP'. The sagittal slice is labeled 'EMP'. The coronal slice is labeled 'EMP'. The software also shows a list of VOIs (Volume of Interest) and their corresponding labels.

# Future work

- We have struggled for grant support and IRB approval.
- We already finished preparatory phase, establishing methodology and normative data for all tests.
- We will start recruiting patients and healthy controls form 2014.
- We will include centers from southern Taiwan.
